SUMMARY

I am a software engineer with practical experience in applied AI, data engineering, LLM-based agentic systems, and embedded systems; I am currently pursuing a Master's degree in Artificial Intelligence and Robotics.
I began my career with internships in the defense industry: first, on an AHRS project developed for UAV avionics at a Havelsan subsidiary, and second, on an image processing and face recognition project at an authorized ASELSAN dealer. In my first corporate experience, I took an active role in a team developing an agent-based RAG decision support system that enables users to query SQL databases using natural language. Additionally, I developed deep learning forecasting models on large-scale international commodity, logistics, and price data.
In my most recent corporate experience, I worked as an IT specialist and project manager on an EU-funded project, taking on roles in web development, data analysis, and software consulting. I managed project coordination, procurement, and documentation processes by working closely with various stakeholders. Alongside this, I maintain an active freelance web development practice, creating client websites and translating business requirements into practical solutions.
On the data side, I have built and operated web scraping and browser automation pipelines for real clients. I took responsibility for ensuring data quality by collecting, cleaning, and transforming data from e-commerce platforms like Amazon, Next, and AliExpress, and prepared structured reports.
With machine learning, I transform problems into measurable analyses and experiments. I am continuously developing my skills across the entire model lifecycle—including supervised and unsupervised learning on large-scale real-world datasets, dataset preparation, training, fine-tuning, evaluation, inference, and integration with backend systems. On the generative AI side, I develop LLM-powered systems, RAG systems, autonomous AI agents, and chatbot-style natural language interfaces using embeddings, vector databases, and prompt engineering.
My goal is to design, build, and maintain reliable, reproducible, and well-documented software systems that transform corporate data sources (operational, customer, and business process data) into insights that improve efficiency and customer experience; and to develop analytical solutions that integrate machine learning models into functioning applications.
I am currently working on projects aimed at applying these skills to production-oriented AI systems in areas such as identity verification, document-centric AI, fraud detection, and risk analytics. Working with corporate data sources as part of collaborative, interdisciplinary teams, I aim to transform ideas into working products within an agile AI environment. I clearly communicate technical findings to both technical and non-technical audiences and closely follow the latest technological advancements.

TECHNICAL SKILLS

Programming Languages: Python, C#, C++, Java, JavaScript, HTML/CSS, Arduino

Generative AI & LLM: Large Language Models (LLM), Agentic AI & Multi-Agent Orchestration, RAG (Retrieval-Augmented Generation) Architectures, Prompt Engineering, Function/Tool Calling, Text-to-SQL, LLM APIs (OpenAI, Anthropic, Gemini), Azure OpenAI, locally-served vision-language models, Model Evaluation & Guardrails, Embeddings & Semantic Search, FAISS, CrewAI, VannaAI

Machine Learning & Deep Learning: TensorFlow, PyTorch, Scikit-learn, Hugging Face, BERT, CNN/RNN/Transformer Architectures, NLP, XGBoost, LightGBM, Time-Series Forecasting, Anomaly Detection, Computer Vision (OpenCV, YOLO)

Data Engineering & Databases: SQL, PostgreSQL, MySQL, MongoDB (NoSQL), Vector Databases (Chroma, Pinecone, etc.), Pandas, NumPy, Matplotlib, JSON, Big Data, Data Preprocessing (Data Preparation, Cleaning, Transformation, Validation, Quality)

Embedded Systems & IoT: AHRS (Attitude and Heading Reference System) Development, OBD (On-Board Diagnostics) Data Analysis, Sensor Integration

Data Acquisition (Web Scraping) & Automation: BeautifulSoup, Scrapy, Selenium

Development Tools & Technologies: Git/GitHub, Docker, AWS, Model Context Protocol (MCP), Claude Code, Cursor, WordPress, Operating Systems (Windows, Kali Linux)

EXPERIENCE

FREELANCE — WEB SCRAPING - WEB DEVELOPMENT – SOFTWARE CONSULTING *February 2023 – Present*

Web Scraper

- Build and run weekly web-scraping pipelines (Python, Scrapy, Selenium, BeautifulSoup) across e-commerce platforms (Amazon, AliExpress, next.co.uk), processing roughly 500,000 products per week.
- Deliver structured, recurring data reports that support business operations and decision-making.

Web Developer

- Designed and built 5 client websites — including a company affiliated with Malatya Metropolitan Municipality, a law consultancy firm, a construction company, and a car rental business — and provided technical support on a comparable number of additional development projects.
- Grew this freelance practice independently into an ongoing side business, sourcing and managing client relationships directly.

Software Consultant | Python Developer

- I provide Python development, code optimization, debugging, and technical consulting services to professionals and companies across various sectors. I am actively seeking freelance opportunities.

GOPA DANIŞMANLIK *April 2025 – September 2026*

Project Assistant | IT Specialist

- I coordinated project monitoring, reporting, and documentation processes for an EU-funded project, while also supporting its ongoing operations and procurement activities.
- I managed the project's software-related services and designed and developed the brand/company website from the ground up
- I was involved in IT infrastructure services, including the setup of server rooms, certification processes, and software procurement requirements. Additionally, I conducted data analysis to support project decision-making and budgeting processes..

BİGOEN *September 2024 – March 2025*

Artificial Intelligence Engineer

- As part of a five-person engineering team, I developed machine learning algorithms—leveraging deep learning architectures—for decision-support systems that utilize large-scale international datasets related to agricultural commodities and logistics pricing.
- Built an agentic AI system with a natural-language (RAG-based) query interface, achieving high accuracy while removing the need for manual SQL (Text-to-SQL) queries.

BAŞARAN İLERİ TEKNOLOJİ ASELSANNET BAYİ *August 2023 – October 2023*

Image Processing Engineer Intern

- Developed a small-scale image processing and facial recognition project for surveillance camera applications in the telecommunications field.
- Gained cross-functional experience in communication and project management alongside technical implementation.

TÜMER MÜHENDİSLİK *August 2022 – September 2022*

Embedded Systems Engineer Intern

- Contributed to an AHRS (Attitude and Heading Reference System) project for UAV avionics systems in the defense industry.
- Developed problem-solving skills while working through a technically complex embedded systems process.

EDUCATION

Fırat University — Master's Degree, Artificial Intelligence and Robotics
In Progress

Fırat University — Bachelor's Degree, Software Engineering
2025

LANGUAGES

Turkish — Native / English — Intermediate (B1)
